

Dynamic Software License Configuration

ABSTRACT OF THE DISCLOSURE

[0058] A user software license is dynamically managed. A server receives a plurality of requests from a client to access at least one feature of a software program. Each request includes identification information concerning the user, and license verification information concerning the user. Responsive to receiving a request, the server retrieves stored software license information concerning the user, the stored software license information corresponding to the received identification information. The server determines current software license information concerning the user. The server returns the current software license information concerning the user to the client. The client receives and stores the current software license information.
